How money moves through the Operations CRM

 Payments · Extras · Settlements · Billing · Expenses · Banks · Claims

\$18.4k

Received this month

\$3.1k

In circulation

\$14.2k

Deposited

1 The money map — read this first

One page that explains the whole system. Everything else is detail.

The CRM tracks money in **two parallel worlds**, and one module that ties them together:

The operational world — what *should* happen

Jobs create **charges** (balances, extras, BOL, storage billing). **Payments** records every dollar collected against those charges, who physically holds it, and when it reached the bank. **Expenses** records every dollar spent (fuel, hotels, payroll, materials). These are *our* books.

The bank world — what *actually* happened

Banks is the real bank ledger: every movement imported from the bank statements, categorized by one person and **verified by a second one**, then rolled into the official **P&L**. The bank never lies — this is the ground truth.

 **Reconciliation is the bridge.** The Banks → Conciliación tab cross-checks both worlds: every deposit recorded in Payments should appear in the bank, every bank-paid expense should have its bank line, and every bank movement should have an operational explanation. When all three lists are empty, **"the numbers add up ✓"**. Anything left over is exactly where to look for missing records — or missing money.

The life of one dollar (worked example)

- 1 **A charge is born.** Job #2214 is created: \$800 due at pickup, \$1,200 at delivery. On the road the client adds packing → an **extra** of \$200 is registered. Total expected: **\$2,200**.
- 2 **It gets collected.** The driver collects \$800 cash at pickup. Someone enters it in **Payments** (+ Payment): method cash, received by the driver — the system marks **who has the money**. It is now **in circulation**: received but not in the bank.
- 3 **It gets allocated.** At delivery the client pays \$1,500 by Zelle. Using **"Assign to charges"** the payment is split: \$1,200 to the delivery balance, \$200 to the packing extra, \$100 left **on account**. Zelle is digital → marked **deposited automatically**.
- 4 **It reaches the bank.** The driver deposits the \$800 cash; in the **In circulation** view it's ticked and batch-deposited to "Chase Operations". Payments now shows: received \$2,300 · in circulation \$0 · deposited \$2,300.
- 5 **The bank confirms it.** The statement is imported into **Banks** (screenshot or CSV). The \$800 deposit and the \$1,500 Zelle appear, get categorized ("Job"), and a **second person verifies** them. Reconciliation matches them against Payments — no discrepancies.
- 6 **It becomes profit.** The verified inflows land in the **P&L** as Revenue; the driver's pay for the day (Expenses → Días trabajados), his commission on the extra, and the fuel he bought flow in as costs. Revenue – costs = what the company actually made on the job.

Who does what (typical roles)

PERSON	DAILY JOB IN THE MONEY FLOW
Dispatcher / back office	Enters payments as they're collected, allocates them to charges, sends WhatsApp deposit requests, keeps balances up to date on jobs.
Driver	Collects at pickup/delivery, holds cash/checks until deposited, hands in receipts for road expenses, returns unspent driver-cash.
Finance / bookkeeper	Approves expenses, runs the weekly pay grid, imports bank statements, categorizes movements, watches reconciliation, reads the P&L.

Second reviewer (any teammate)	Verifies bank movements categorized by someone else — the double check . The verifier must always be a different person.
Manager / admin	Watches the red alerts (cash 7+ days undeposited, overdue billing, open claims), settles broker closing sheets, triages claims.

2 Where money is born: the four kinds of charges

Every dollar the company expects to collect starts as one of these four charges. Payments are always applied *against* a charge.

CHARGE	WHERE IT'S CREATED	WHAT IT IS
 Job balances	Job form — "Balance to collect at pickup" and "Balance to collect at delivery"	The base price of the move, split into what's due at each end. Shown on Dispatching as Bal. pickup / Bal. delivery and included in every trip's "To collect".
 BOL balance	Job form, Carrier/BOL section (broker deliveries)	What the client owes on a broker delivery per the Bill of Lading (rate per CF × volume + services). Collected at the door; feeds the broker's closing sheet.
 Extras	Extras section (per job), the Extras page, or on the fly while allocating a payment	Additional charges: extra CF, shuttle, long carry, stairs, packing, flight charge, other. Each carries a driver/rep commission (section 4).
 Storage billing	Job form, "Storage billing" section	A recurring monthly fee for keeping the client's goods. The system generates each 30-day charge automatically (section 6).

Where do I see what a job still owes? Open the job (tap the Job #) → **Payments section**: expected / collected / outstanding, per-extra status, CC fees, and any money sitting "on account". The same outstanding number drives the Dispatching labels — **Outstanding** while active, **Not collected** once delivered (that one is the top-priority red flag: the goods are gone and the money isn't in).

3 Payments — collections, circulation, deposits 💰

The heart of finance: every dollar received, who physically holds it, and whether it reached the bank.

The three states of a collected dollar

🇺🇸 **The golden rule of methods.** **Digital** payments (Zelle, Venmo, credit card, wire, PayPal, Cash App, Apple Pay) go straight to **deposited** — the money lands in an account by itself. **Physical** payments (cash, checks, money orders) stay **in circulation** — a person is literally carrying that money — until someone marks them deposited. Circulation is where money gets lost; that's why the module watches it so hard.

Entering a payment (+ Payment)

- **Job** (search by number or client) · date · **amount** · **concept**: Job / Extra / CC Fee / Storage / **On account** / Other · optional **discount + reason** (net = amount – discount) · **stage** (at pickup / at delivery / other).
- **Method-specific fields**:
 - **Check** — type (cashier's / personal / official), **serial number with live duplicate warning** (catches the same check entered twice), bank/issuer, date, memo, and a **photo of the check**.
 - **Money order** — type (USPS / Western Union / MoneyGram / other), serial (also dup-checked), office, purchaser, and a photo.
 - **Credit card** — tick "**Charge CC fee to client**" (3% default): the system computes the total to collect and creates the separate **CC Fee** payment automatically.
- **Received by** (person + date). For physical methods: "**Who has the money?**" — auto-filled with the job's driver — and, if already deposited, the date and **bank account**.

Allocation — "Assign to charges" ✂️ (the most important habit)

A client rarely pays charge by charge — they hand over one amount. Allocation is how one payment gets **split across the job's charges** so every charge shows its true remaining balance:

- Tick "✂️ **Assign to charges (split)**" in the payment modal. One line appears per charge: the **job balance** and each **pending extra**, each showing "**Pending: \$X**".
- Type an amount per line — the system proposes a sensible split automatically (job balance first, then extras oldest-first) and shows the **remainder per charge** live. Overpaying a line is allowed (flagged), but the lines can never exceed the payment total.
- Anything you don't assign stays "**On account**" — received but not applied. It shows on the job as "**A cuenta (sin imputar)**" with an **Assign** button; use it later to apply that money to charges (the modal reopens with the amount locked and the split pre-spread over what's still owed).
- + **New extra / another line** creates a brand-new charge on the spot (choosing the concept — extra CF, shuttle, long carry...) and it immediately enters the commission system.

Why it matters: without allocation, a job can look "paid" in total while a \$200 extra is actually unpaid (and its commission unpayable), or look unpaid while money sits on account. Allocation keeps **every charge's remaining balance** true — which is what the Dispatching labels, the trip "To collect", and the commissions all read.

In circulation — the anti-loss view

- The **In circulation** tab groups undeposited money **by the person holding it**: total on hand, breakdown (cash / checks / money orders), and each payment with the **days held**.
- 💬 **Request deposit** — one click opens WhatsApp with the list of what they're holding and a request to deposit by end of week.

- **Batch deposit** — tick items (or Select all), pick the **bank account** and date, hit ✓ **Deposit N** • **\$total**: all of them are marked banked in one shot, with the account recorded (that's what reconciliation will match against the statement).
- The **red alert** on top of Payments lists everything received but **not deposited for 7+ days** — that list should be empty. Chase it daily.

Reading the numbers

- **Metrics**: Expected this month · Received (green) · **In circulation** (red — all undeposited money regardless of month) · Deposited (blue) · Pending collection (orange) · CC fees (purple). Note: In circulation ≠ Received – Deposited, because it includes older months' cash still out there.
- **Weekly cash flow** (bottom): expected / received / in circulation / deposited for the current week, plus the **projection** if everything in circulation were deposited.
- 🔍 **Job verdict**: search a job number and a banner answers "does this job have payments?" — ✓ with count/total/received, ✗ "No payments recorded", or ⚠ no such job.

🔄 **One entry, never two.** Recording a BOL collection in **Settlements** (or on the job's Carrier Settlement section) automatically creates/updates the matching payment in Payments — and vice versa. Money is entered **once**, wherever it's most convenient.

4 Extras & Commissions +

Extras are additional charges on a job; a slice goes to whoever generated them.

- **The 7 types:** Extra CF · Shuttle · Long carry · Stairs · Packing · Flight charge · Other.
- **Registering one:** from the job detail (+ **Add extra**), from the Extras page (each job shows the 7 types as tickable rows), or automatically when a payment split creates a new extra line.
- Each extra records: **amount**, the **driver** who generated it (defaults to the job's driver), "**generated by**" (Driver only / Driver + Rep / Rep only), the **rep** if involved, and the commission percentages — **auto-filled by the rules below, editable** per case.

EXTRA TYPE	DRIVER ONLY	DRIVER + REP	REP ONLY
Extra CF / Packing / Flight / Other	Driver 10%	Driver 7% / Rep 3%	Rep 10%
Long carry / Stairs	Always driver 50% — the company keeps the other 50%		
Shuttle	Driver 10%	Driver 7% / Rep 3%	Rep 5%

- **The Extras page** has two tabs —  **Drivers** and  **Reps / Back office** — each grouping extras by person, with month metrics on top: total extras, driver commission (green), rep commission (blue), and **what's left for the company** (amber).
- Under each person: a **TOTAL** row and a yellow **COMMISSION** row (Excel-style), with  **Copy** and  **PDF** buttons to send each driver/rep their commission summary.
- Each rep has a **profile** (tap the name): commission per month and full extra history.

 **An extra only pays commission when it's collected.** Keep extras allocated (section 3) — an unpaid extra shows as pending on the job and in the driver's summary, and unallocated "on account" money doesn't count toward it.

5 Settlements — broker closing sheets

For broker deliveries: the running account between us and each broker.

- A **closing sheet** groups a broker's jobs. For each job it tracks: CF delivered, the **carrier fee** (what the broker pays us to deliver — auto-computed), the **BOL balance** and what was **collected at the door**, pads, and costs.
- The sheet's bottom line is the **net settlement**: collected BOL money is ours to keep against the carrier fee — the net says **who owes whom** (broker → us, or us → broker).
- **Workflow tabs:** Open (still accumulating jobs) → Settled (paid out) → Disputed. Jobs are **linked from the job detail** (Carrier Settlement section), where you can also move a job to another open sheet or a new one.
- **Record payment** on a job's BOL (amount, method, date) — synced automatically with Payments (never entered twice). The collection status badge shows Collected / Partial / Pending.
- **Export to PDF** — the closing sheet formatted for sending to the broker.

Watch for: the orange **Collection pending** label on Dispatching — a broker delivery already delivered whose BOL isn't fully collected. That's money at the door that didn't come back.

6 Storage Billing — recurring monthly revenue

Clients who keep goods in storage pay a monthly fee. The system runs the cycle by itself.

- **Setup (once per job):** in the job form, tick "**Bill this client for storage**", set the **monthly rate**, and choose whether the **first month is free** — the start date computes itself from the date the goods came in.
- **Every 30 days** the system generates the charge automatically and marks it **overdue** when unpaid past the due date. No one has to remember.
- **The Billing page:** metrics (total pending, overdue, due this week, collected this month) and tabs (All / Pending / Overdue / Paid). Per charge: **Mark paid** and a  **Reminder** — a pre-written WhatsApp to the client.
- Overdue storage billing also appears in the Dispatching metrics bar (**Billing overdue**, red) so it's never out of sight.

7 Expenses — spend, driver cash & the weekly payroll

The outflow side: what the operation spends, and what each driver earns and owes.

7.1 Expenses with approval (Gastos tab)

- **+ Expense:** date, **category** (Fuel  / Hotel  / Materials  / Tolls  / Maintenance  / Meals  / Other), amount, vendor, optional driver / truck / trip / job #, and — always — the **receipt photo or PDF**. Fuel expenses add gallons, odometer and IFTA state, with \$/gallon computed.
- **Paid with** is the key field: **Bank account** (pick which — reconciliation will look for it on the statement), **Company card**, **Other**, or **Driver cash (from collections)** — see below.
- **Approval flow:** every expense starts **Pending**; someone with edit rights hits  **Approve** or  **Reject**. Only **approved** expenses count in P&L and Driver P&L math.

 **Driver cash — the loop that must close.** When a driver pays fuel or tolls out of the **cash he collected from clients**, record the expense as "paid with driver cash". The system keeps the reconciliation live: **cash on hand — unsettled expenses = what he should hand in**. When he hands in the remainder, hit  **"settled"** on those rows. The "Driver cash not settled" tile on top tells you how much collected money is currently being spent on the road instead of deposited — keep it near zero.

7.2 Días trabajados — the weekly pay grid

- **The pay week runs Wednesday → Tuesday and is paid the following Wednesday.** Navigate weeks with ← / → ; the blue pill shows the payout date.
- One row per driver, one cell per day. **Click a cell to cycle:** empty → ✓ **full day** (pays the daily rate) → ½ **half day** (half the rate) → **hourly** (asks the hours; pays hours × hourly rate) → empty.
- **Rates live on the driver record** (Daily rate \$/day, Hourly rate \$/hour). The rate is **frozen the moment you mark the day** — a later raise never rewrites weeks already recorded. A driver with no rate shows "no rate set" in red: fix that first.
- **+ Adjustment (fuck-up / bonus):** a **deduction** (client's mirror broken, no-show, missing material...) lowers that week's pay; a **bonus** raises it. Always entered as a positive amount + type + reason + optional job #. The week's adjustments are listed under the grid, and the driver's row shows Days · Pay · Adjustments · **Week total**.
- The bottom row — **"Total to pay on Wed DD/MM"** — is the payroll number for the whole team. That payment then shows up in Banks as Salaries when it hits the statement.

7.3 Materials

- A **catalog** of supplies (pads, boxes, shrink wrap...) with unit costs, and a **movement log:** Purchase (into stock) / **Issue** (handed to a driver) / **Return** / **Consume** (used on a job) / Adjust.
- The **"On hand per driver"** panel computes issued — returned — consumed: a red balance is material the driver still owes back, **valued in dollars**. Chase it like cash.

 **Driver P&L — what each driver really earns you.** Per driver and month: revenue attributed from his jobs — labor (work days × frozen rates) — approved expenses — commissions ± adjustments = **net and margin**. Visible in Analytics and in the driver's profile. This is why marking days, approving expenses and allocating extras matters — they're the inputs.

8 Banks — real ledger, double check, P&L

Everything above is what we *say* happened. Banks is what the bank *says* happened — and the bank wins.

8.1 The lifecycle of a bank movement

 **The double check is the anti-fraud control.** The person who verifies a movement **must be different** from the person who categorized it — the system physically blocks self-verification. Editing an already-verified movement **reopens** the double check. No single person can quietly decide what a bank movement "was".

8.2 Getting movements in (↑ Importar)

METHOD	HOW IT WORKS	LANDS AS
 Screenshot (AI)	Upload homebanking screenshots; the AI extracts every line (date, description, amount, direction, suggested category with confidence) into a "Review before importing" table you confirm. The screenshot itself is stored as evidence.	Sin revisar
 Bank CSV	Upload the bank's CSV export, map the columns (date / description / amount, or debit + credit), extract, review, confirm. AI suggests categories in batch.	Sin revisar
 CSV maestro	The bookkeeper's master export with an account_name column: rows route to each account automatically (names must match exactly), thousands at a time, with a preview of per-account counts and totals.	Verified directly (already categorized)
+ Manual	One-off entries (a single wire, a correction): account, in/out, dates, amount, category, description, method, reference, counterparty.	Sin revisar (same double check)

No duplicates, ever: every import is deduplicated by account + date + amount + description — re-uploading the same statement is harmless. And the **Bandeja** organizes everything in 📁 month folders with a red badge for what's still unreviewed; inside, pages of 100 with server-side filters (status, account, direction, category, text search) so totals always reflect the whole ledger.

8.3 Accounts & categories

- **Cuentas:** each bank account with opening balance and a **computed balance** (opening + all non-ignored movements). If the computed balance doesn't match homebanking, **imports are missing** — that's the tell.
- **Categorías:** the chart of accounts — the same categories as the bookkeeper's Bank Flows Excel (Job, Refund, Hotels, Fuel, Salaries, Toll, Truck Repair, Storage, Fees, Taxes, Broker, Marketing, Transfer Between Accounts...), each with a direction and a **P&L group** (Cost of Revenues / Production / Structure / Sales & Marketing / Broker / CapEx). Renaming a category updates all its movements; deactivating hides it without touching history.

8.4 Conciliación — does it all add up?

- Matches bank lines against **Payments** (deposits: amount + date within tolerance) and **Expenses** (bank-paid). Internal transfers are excluded.
- Three discrepancy lists, each an action item:

- **Bank money with no backing** — a movement with no operational record. Investigate: unrecorded income, an expense nobody logged... or worse.
- **Deposit that never hit the bank** — a payment marked deposited that the statement doesn't show. Where is it?
- **Expense with no bank line** — recorded as bank-paid but absent from the statement (or that period isn't imported yet).
- Green summary — **"the numbers add up ✓"** — is the goal state every week.

8.5 The P&L — the company's real income statement

- Classic layout, **months as columns**, expenses in red parentheses: **Revenue → (Cost of Revenues) → GROSS PROFIT → (Production) → (Structure) → (Sales & Marketing) → (Broker) → (CapEx) → NET PROFIT**, with margin % tiles on top.
- **"Verified only" is on by default** — the P&L is built exclusively on double-checked data.
- **Excluded on purpose:** transfers between accounts, and **Financing / Financing-Loan / Financing-Capital / Credit Card Payment** — they move cash but are not income or operating expense, so they'd distort profitability.

9 Claims & Incidents — money at risk ⚠️

Every incident is a potential payout. Track it from report to resolution, with the dollars attached.

- **Report** with + New claim (or from the job/trip detail, pre-filled): incident date, type (💣 Damage / 🚒 Theft / 🔍 Missing items / 📦 Incomplete delivery / 🗣️ Complaint / 📝 Other), assignee, description.
- **The two money fields: Claimed \$** (what the client demands) vs **Paid / settled \$** (what it actually cost us), plus the resolution: paid to client / denied / covered by insurance / discount applied.
- **Workflow:** Open → Investigating → Resolved (or Denied). Attach **evidence** (photos/PDFs) and keep the **follow-up log** — every status change is logged automatically. Active claims older than 14 days turn red.
- Top metrics: open, investigating, resolved this year, **total claimed vs total paid**, average days to close. Claim payouts should reappear in Banks under the "Claims" category — another reconciliation point.
- If a driver caused the damage, the corresponding **deduction** is entered in Expenses → + Adjustment, linked to the job — so the cost lands on his week and his P&L, not just the company's.

10 The finance routines — daily, weekly, monthly ✅

☀️ Every day

- Enter every collection in **Payments** the day it happens, allocated to its charges.
- Chase the **red alert**: nothing 7+ days in circulation.
- Check Dispatching for **Not collected** and **Collection pending** labels.
- Log road expenses with receipts; approve or reject what's pending.

📅 Every week

- Complete the **work-days grid** and adjustments; pay Wednesday's total.
- **Batch-deposit** what's in circulation; settle driver cash 💰.
- Import the week's **bank movements**; categorize; get them verified by a second person.
- Open **Conciliación** — drive the three lists to zero.

📅 Every month

- Review **Storage Billing** overdue and send reminders.
- Settle broker **closing sheets**; export PDFs.
- Send drivers/ reps their **commission PDFs**.
- Read the **P&L** (verified only) and the Analytics alerts — negative-margin units, AR aging, vacancy bleed.

Finance glossary

TERM	MEANING
Charge	Anything the company expects to collect: job balance, BOL balance, extra, storage billing cycle.
Balance (pickup / delivery)	The part of the job price due at each end of the move.
BOL balance	What the client owes on a broker delivery per the Bill of Lading.
Allocation / Assign	Splitting one payment across a job's charges, line by line.
On account	Money received but not yet applied to any charge. Apply it with "Assign".
In circulation	Collected physical money (cash/checks/MOs) someone holds that isn't in the bank yet.
Banked / Deposited	Money that reached a bank account (digital methods get there automatically).
CC fee	The card surcharge (3% default) charged to the client, tracked as its own payment.
Commission	The driver's/rep's share of an extra, per the rules table (10% / 7+3 / 50%...).

Carrier fee	What a broker pays us for delivering their job — the credit side of a closing sheet.
Net settlement	A closing sheet's bottom line: who owes whom, after BOL collected vs carrier fee.
Driver cash	Client money a driver spends on the road; must be "settled" (👉) when he hands in the rest.
Pay week	Wednesday → Tuesday, paid the following Wednesday. Rates freeze when the day is marked.
Adjustment	A deduction (fuck-up, damage) or bonus applied to a driver's weekly pay.
Double check	Banks rule: the verifier of a movement must differ from its categorizer.
Reconciliation	Matching the bank ledger against Payments and Expenses until no discrepancies remain.
P&L	The income statement built from verified bank movements, by month, financing excluded.
Driver P&L	Per-driver profitability: his revenue – labor – expenses – commissions ± adjustments.
Claim	An incident with money attached: claimed \$ vs paid \$, tracked to resolution.

Questions? Ask the manager — or in the general channel in Chats. Keep the circulation at zero and the reconciliation green. 🍀
